Project Description

This project is based in the Pathology Division of Cincinnati children's hospital and involves study of pediatric liver tumors. Pediatric liver tumors are a rising cause of morbidity and mortality in children. This project involves a combination of tools to study the liver tumors such as histopathology assessment, immunohistochemistry, molecular testing, image analysis, annotation of digitally scanned slides, data analysis, and basic statistics. Work done during this period is expected to lead to a publication with the candidate getting first or co-authorship depending on the contribution.
